Part 1 Script Run Instructions

Getting your environment ready to run the two scripts is relatively simple. These instructions are for someone running the Ubuntu operating system.

First, we need to update our system using the following command:
`sudo apt update.`

Next, we have to install python. More specifically, we install python3 (because our script uses python3 logic), and co packages that we need for smooth python3 experience. That can be done with the following command:

```
sudo apt install -y python3 python3-pip python3-venv
```

It is generally a good idea to verify that python3 and pip3 are installed correctly. That can be done using the commands:

```
pip3 --version  
python3 --version
```

You want to see something that indicates a version of python 3.8+

Finally, you have to install the modules that our python script uses using pip3, using

```
pip3 install numpy scipy matplotlib scikit-learn
```

Finally, you can run our scripts using the following commands

```
python3 feature.py
```

```
python3 LogisticRegression.py
```

```
python3 RandomForest.py
```
